PROGRAM

Just another day ...

To you it's just another day. Get up, get ready and out the door to your jobsite. Same as yesterday and the day before.

But to Mark's Commercial it's anything but just another day. To us it's making sure that the companies across Canada we supply with their footwear and workwear have what they need, when they need it, so they can get their jobs done and can come home safely.

Our days are always different but in the end it's what keeps you working in the right footwear, the right workwear, the right PPE. It's what keeps our day from being anything but . . . just another day.

METGUARD

FOR THE TRENCH

MEN'S METGUARD BOOTS

Why Metatarsal Work Boots Are So Important In The Workplace.

Metatarsal is the name given to the five bones found in the middle of the foot that form the arch and connected to tissues, ligaments and tendons, providing movement in the foot. This area of the foot is vulnerable to falling objects as there is virtually no flesh, muscle or fat protecting these important bones which makes wearing boots with metatarsal guards so important.

Safety Toe Versus Metatarsal Work Boots

The safety toe will protect primarily the big toe and two to three toes leaving the rest of the foot back to the ankle area susceptible to injury. In this small unprotected area there is 26 bones, 33 joints, 107 ligaments, 19 muscles plus tendons and nerves which can be protected with the addition of a metatarsal guard in work boots.

Choosing A Metguard Boot

There are two types of metatarsal guards - external and internal. They both have to meet the same CSA Z195-14 and ASTM standards, using a specific impact test for metatarsal guards. A 50-pound weight in the shape of a 1 inch diameter bar is dropped eighteen inches onto the metatarsal area of the shoe, resulting in a 75 foot-pound impact to the metatarsal guard. A full 1-inch clearance must be maintained under the metatarsal impact area on the inside of the shoe. The results are clearly seen and measured from a soft wax foot-form, which was placed within the shoe before the test and removed afterward to measure the deflection of the guard during impact.

The Difference Between External and Internal Guards?

External metatarsal guards have the layer of protection on the outside of the footwear, like a turtle's shell. A protective material is usually attached to the toe of the shoe and extends upwards and covers the entire top of the foot. Internal metatarsal guards have the layer of flexible protection on the inside of the footwear offering more comfort. Both guard designs have been improved over the years to offer a high degree of protection with improved resilience and comfort.

Metatarsal boots are very necessary in many environments. It is important to remember that certain industries and companies have specific requirements, regarding which guard they prefer; however, advanced technology has made either option much safer, and more comfortable, in addition to being available in a myriad of styles.

AVAILABLE

Now That You're Wearing Them.

Rotate Your Footwear

Most workers buy a pair of boots and wear them till they're worn out. Boots (and shoes) last much longer if they are rotated in use. Alternating 2 pairs gives each one a chance to completely dry out between uses. Your boots will last longer and your feet will be more comfortable.

Maintain Your Boots

All boots will last longer and be more comfortable if they are well taken care of:

Dry Your Boots

Allow your boots to dry after a long day on the job. Boots like to air dry without excessive heat. Never subject your boots to more heat than your hand can stand. Remove insoles to speed drying. If your boots get soaked, fill them with wads of newspaper. It will draw out the moisture from within.

Keep Them Clean

Remove mud to keep the leather from drying out. A stiff brush works well and avoids getting your boots wet. Remove salt with a mild solution of vinegar and water.

Leather Boots Like Conditioner

Waterproof leathers do not need the same level of conditioning as regular leathers but all leathers benefit from conditioner. Boots should be clean and dry before applying conditioner. Oil-based treatments will soften the leather. Silicone- or PTFE based treatments add waterproofing without softening the leather.

AVAILABLE

The Language of Footwear

ANSI International standards organization that develops and publishes voluntary consensus technical standards for a range of materials.

Aerospace Lining A breathable synthetic lining comprised of a mesh-like structure.

Anti-microbial A chemical treatment applied to footwear linings which prevents microbe growth.

ATCP Aluminum toe, composite plate.

Cement Construction A shoe construction in which the upper of a shoe is cemented, rather than stitched, to the bottom of a shoe. Cement construction results in a lighter, more flexible shoe.

Contoured Footbed An insole that molds to the shape of your foot.

Composite Plate A safety, puncture resistant sole plate used in safety footwear in replacement of steel plates. A few varieties exist today, made of synthetic materials such as nylons, resins and also Kevlar.

CTCP Composite toe, composite plate.

Dri-Tec A generic term for breathable, moisture-wicking lining found in footwear.

Dual Density Midsole A midsole that employs two different densities of cushioning foam.

ESR Electrical shock resistance.

EVA Ethylene Vinyl Acetate - A synthetic compound used for outsoles. EVA provides cushioning to the footbeds, midsoles, and is easily shaped by heat and pressure.

Footbed Sometimes also referred to by customers as the insole. It is the foundation in footwear that rests under the foot and has a critical role in comfort.

Goodyear Welt Construction A shoe construction in which the upper and sole of the shoe are stitched together, resulting in greater durability. The resulting seam is visible and runs around the outside of the shoe, where the upper and outsole meet.

Green Diamond Technology Patented silica carbide crystals are embedded throughout the rubber outsole which are durable and long lasting traction on ice.

Heel Counter Counters provide support and help the upper wrap around the foot.

Injection Molded Construction A type of sole unit construction created by injecting material into the sole mold. Injection molded construction is an efficient way to mass-produce footwear.

Inseam The hidden seam of a welted shoe holding together the welt, upper, lining and insole.

Metguard A safety feature found in some boots which is comprised of a protective cap that covers the metatarsal area of the foot and protects against injury from impacts. Can be internal or external.

Moisture Wicking Synthetic materials that have been developed specifically to channel perspiration away from the body.

Nubuck Leather Nubuck is a type of leather with a soft, velvety surface and is far more durable than suede.

Carprene Rubber that is acid and oil resistant.

OrthoLite OrthoLite insoles are made up of open-cell foam, allowing air to circulate around the foot, keeping it cooler inside the shoe. The open cell structure also moves moisture away from the foot, keeping it drier.

PU Polyurethane; a type of man-made material.

PVC Polyvinyl chloride. A semi-rigid plastic, often used in heel counters and outsoles for added support.

SD Static Dissipating. The shoe dissipates static buildup on the body so as not to cause an arcing effect.

STSP Steel toe, steel plate.

STCP Steel toe, composite plate.

TPR Thermo plastic rubber. A plastic material used by many manufacturers in the injection molding process.

TPU Thermopolyurethane. Man made material used in footwear production on uppers, but also outsoles.

Upper The part of the shoe that covers the top part of the foot, from heel to toe.

Welt A strip of material sewn between the insole and the outsole to create greater durability.

MEN'S SLIP RESISTANT

When you're on your feet all day, slip resistant footwear is a "must have".

In work environments where you are on your feet all day, a large number of the accidental slips, trips and falls reported, are preventable by the wearing of slip resistant footwear.

Mark's Commercial has a full line of slip resistant footwear suited to any workplace in Canada. Our footwear brands are well-respected and have special combinations of special rubber outsole compounds combined with unique tread patterns to give you unprecedented anti-slip qualities in a variety of conditions.

Our many styles of anti-slip footwear are safety oriented, yet stylish at the same time. Lace-ups to slip-ons, our shoes keep you working at the job you love.

WOMEN'S HIKERS

Women's feet are different than men's

The primary difference between men and women's running shoes is the width of the shoe. Compared to the corresponding men's shoe, women's shoes are built wider in the forefoot and toe area and narrower in the heel, reflecting the gender differences in foot shape. Furthermore, men's shoes are generally wider and sized larger than women's shoes. Some shoes, despite being branded as the same shoe for different genders, have different midsole materials or heel support, affecting the fit, comfort and even weight of the shoe.

Women have, on average, 15 percent less muscle than men, causing them to weigh less than men of comparable height and shoe size. Therefore, the midsole in a woman's shoe is designed to sustain 15 percent less impact as each foot strikes the ground. Because of this, women's shoes usually contain a lighter and softer midsole than the men's version. Furthermore, while both men and women's shoes have flex grooves carved into the forefront of the outsole, these grooves will be significantly deeper on the women's shoe. This is because women's lower-body mass makes it harder to flex the midsole, so the grooves are added to help.

What The Symbols Mean

TARANTULA ANTI-SLIP®

Our TARANTULA ANTI-SLIP® outsoles provide the ultimate in slip protection and dramatically reduce the likelihood that you'll slip or fall on wet/greasy surfaces. To achieve this high performance, the outsoles use a unique tread pattern and advanced compound to increase the coefficient of friction. Our anti-slip outsoles provide incredible grip to resist slipping on the majority of surfaces including wet, soapy, oily or greasy surfaces. To achieve this high performance, the footwear has a unique tread pattern and soft rubber compound to increase the coefficient of friction. Many other shoe outsoles hydroplane on wet surfaces, resulting in poor traction for the wearer. TARANTULA ANTI-SLIP® outsoles, however, push liquids to the outside using unique micro channels, instead of keeping liquids underfoot.

DISCLAIMER: TARANTULA ANTI-SLIP® footwear has been tested for wet and dry conditions. They have not been tested for use on any type of ice. In order to qualify, they must meet or exceed our slip resistance standards.

DURATOE®

DURATOE® uses a molded toe cap that is applied to the outside of the work boot to increase the life of the toe area of the boot.

ARMOUR FLEX+® TECHNOLOGY

Non-metallic puncture resistant safety plates. Flexible, multi layer textile composite made from a high tenacity yarn. A metal-free safety plate that bends with your foot for less foot exhaustion. Offers 100% protection of the bottom of the foot, as compared to a steel plate that only protects 85%.

HYPER-DRI®

Waterproof / Breathable. A micro porous membrane or coating is applied to the material allowing body vapour molecules to pass while water droplets remain impermeable.

FRESHTECH®

Anti-Odour / Anti-Fungi FreshTech® is an advanced anti-microbial protection that inhibits the growth of odour and stain causing bacteria for long lasting freshness.

T-MAX®

The warmest, lightest hypo-allergenic insulation on the market. It regulates body temperature by allowing moisture to move away from the body, keeping the body dry and comfortable.

VIBRAM®

Vibram soles are an expert integration of functional design and high performance compounds. Vibram ensures that demanding workers have reliable and safe products for their professional activities, in any situation, in any weather condition or environment. Grip, stability, heat and oil resistance, electrical hazard rated, flexibility: a boot powered by Vibram improves worker efficiency, performance, reliability and comfort.

VIBRAM FIRE & ICE®

The Vibram® Fire & Ice™ compound has been studied for extreme applications and maintains its performance values in a wide range of temperatures (from -20°C to +250°C). The formulation satisfies both requirements for fire resistance from NFPA and the Ross cold flex at -23°C.

Deciphering The Symbols

CSA Green Triangle indicates sole puncture protection with Grade 1 protective toecap which can withstand impacts of 125 joules (22.7 kg object falling from 56 cm above).

CSA White Rectangle with orange omega indicates soles that provide electric shock resistance. Intended to withstand 18,000 volts at 60Hz for one minute without disruptive discharge to ground; leakage current not exceeding 1mA.

CSA Yellow Rectangle indicates soles are static-dissipative.

Warning: This footwear should not be used where contact with live electrical conductors can occur.

CSA Blue Rectangle indicates Grade 1 protective toecap without sole puncture protection.
