It's nice to look forward to "lacing them up" in the morning.

It feels good to market industrial footwear to the workforce across Canada that is built well with innovations that keep your feet comfortable over the course of a long work day.

From moisture wicking that prevents excessive perspiration, to lighter insulations for comfortable feet on colder days, to anti-slip soles like our exclusive Tarantula Anti-Slip.

We take pride in what we sell to you, the workers across Canada who "lace them up" to keep this country moving forward.

Thank you.

3 CONVENIENT WAYS TO SHOP FOR COMPANY FOOTWEAR

It's never been easier for company employees to purchase industrial footwear at your favorite Mark's store.

METGUARDS

WHY METATARSAL WORK BOOTS ARE SO IMPORTANT IN THE WORKPLACE.

Metatarsal is the name given to the five bones found in the middle of the foot that form the arch and connected to tissues, ligaments and tendons, providing movement in the foot. This area of the foot is vulnerable to falling objects as there is virtually no flesh, muscle or fat protecting these important bones which makes wearing boots with metatarsal guards so important.

Safety Toe Versus Metatarsal Work Boots

The safety toe will protect primarily the big toe and two to three toes leaving the rest of the foot back to the ankle area susceptible to injury. In this small unprotected area there is 26 bones, 33 joints, 107 ligaments, 19 muscles plus tendons and nerves which can be protected with the addition of a metatarsal guard in work boots.

Choosing A Metguard Boot

There are two types of metatarsal guards – external and internal. They both have to meet the same CSA Z195-14 and ASTM standards, using a specific impact test for metatarsal guards. A 50-pound weight in the shape of a 1 inch diameter bar is dropped eighteen inches onto the metatarsal area of the shoe, resulting in a 75 foot-pound impact to the metatarsal guard. A full 1-inch clearance must be maintained under the metatarsal impact area on the inside of the shoe. The results are clearly seen and measured from a soft wax foot-form, which was placed within the shoe before the test and removed afterward to measure the deflection of the guard during impact.

The Difference Between External and Internal Guards?

External metatarsal guards have the layer of protection on the outside of the footwear, like a turtle's shell. A protective material is usually attached to the toe of the shoe and extends upwards and covers the entire top of the foot. Internal metatarsal guards have the layer of flexible protection on the inside of the footwear offering more comfort. Both guard designs have been improved over the years to offer a high degree of protection with improved resilience and comfort.

Metatarsal boots are very necessary in many environments. It is important to remember that certain industries and companies have specific requirements, regarding which guard they prefer; however, advanced technology has made either option much safer, and more comfortable, in addition to being available in a myriad of styles.

These women's Aggressor work boots are built for safety and comfort. Tough Nubuck uppers feature durable toe bumpers and breathable mesh and foam linings and are designed for comfort. Removable insoles make room for custom orthotics, and durable polyurethane outsoles are lightweight to discourage foot fatigue. Recommended for general trade, manufacturing, warehousing and distribution workers, these boots feature Grade 1 steel toes and plates and they're electric shock resistant.

Footwear Innovations

TARANTULA ANTI-SLIP®

Our TARANTULA ANTI-SLIP outsoles provide the ultimate in slip protection and dramatically reduce the likelihood that you'll slip or fall on wet/greasy surfaces. To acheive this high performance, the outsoles use a unique tread pattern and advanced compound to increase the coefficient of friction. Our anti-slip outsoles provide incredible grip to resist slipping on the majority of surfaces including wet, soapy, oily or greasy surfaces. To acheive this high performance, the footwear has a unique tread pattern and soft rubber compound to increase the coefficient of friction. Many other shoe outsoles hydroplane on wet surfaces, resulting in poor traction for the wearer. TARANTULA ANTI-SLIP outsoles, however, push liquids to the outside using unique micro channels, instead of keeping liquids underfoot.

DISCLAIMER: TARANTULA ANTI-SLIP® footwear has been tested for wet and dry conditions. They have not been tested for use on any type of ice. In order to qualify, they must meet or exceed our slip resistance standards.

DURATOE

DURATOE uses a molded toe cap that is applied to the outside of the work boot to increase the life of the toe area of the boot.

QUAD-COMFORT

The QUAD COMFORT footwear technology consists of a minimum of 4 comfort components, which address shock absorption, weight distribution, cushioning & pressure displacement and occasionally outsole performance. The construction of the footwear depends on their end use and the requirements of the footwear. The four components are integrated between the footbed or insole through to the bottom of the outsole. If a component provides a significant and functionally noticeable advantage, it may also comprise a feature that is incorporated into the upper of the footwear. Shock absorption is addressed by adding additional cushioning in the heel of the shoe as it is the first areas of contact when walking. Another component of comfort can be added under the ball of the foot to help distribute weight, alleviate pressure points and provide greater energy return. For cushioning and pressure displacement, our footwear uses lightweight, flexible functional midsoles that can be made up of many densities of cushioning. Lastly, outsoles are functionally engineered to provide the utmost in comfort, shock absorption and flexibility.

Other outsole materials may also be considered such as leather if they truly provide a comfort component or benefit to the end user. Our TARANTULA ANTI-SLIP outsoles can be used for QUAD COMFORT footwear to provide a high degree of slip resistance to reduce the likelihood of a slip or fall while still maintaining QUAD COMFORT features in their structure.

ARMOUR FLEX+® TECHNOLOGY

Non-metallic puncture resistant safety plates. This technology is a multi layer textile composite made from a high tenacity yarn. The woven fabric undergoes different treatments to reach the desired level of hardness while maintaining its flexibility. The ARMOUR-FLEX textile insole can be sewn directly onto the upper and offers 100% protection of the bottom of the foot, as compared to the steel plate that only protects around 85% of the bottom of the foot. ARMOUR-FLEX will keep your feet warmer in winter because, unlike steel, it will not conduct heat away from your foot. ARMOURFLEX provides the technology that you need to keep your feet protected, while still allowing your foot to bend.

Hyper-Dri HYPER-DRI 3

ноз

100% Waterproof / Breathable

A waterproof barrier is laminated to the underside of the outer fabric and a durable water repellant (DWR) treatment is applied on the outside. Waterproof zippers and all seams on the garment are sealed to keep you and your valuables dry. Exceeding industry standards, HYPER-DRI 3 represents an impenetrable barrier to the elements while allowing body-generated moisture to escape. For HD3 footwear, the membrane must withstand over 5000 mm of water column without leaking and allow 5000 g/m2 of moisture to pass through the fabric over a 24 hour period. Footwear is water tank tested to 50 000 foot flexes to simulate extreme conditions.

FRESHTECH®

FRESHTECH is a safe and invisible antimicrobial treatment that is applied to our footwear and garment products. In garments the treatment inhibits the growth of bacteria that cause odor. In footwear the treatment inhibits the growth of fungi, mold, and mildew, in addition to odor causing bacteria. The FRESHTECH treatment stops bacteria and fungi from reproducing, which creates a safe and comfortable product. We ensure the effectiveness and durability of FRESHTECH through standard testing.

_T-MAX®

The warmest, lightest hypo-allergenic insulation on the market. It regulates body temperature by allowing moisture to move away from the body, keeping the body dry and comfortable.

VIBRAM[®]

Vibram soles are an expert integration of functional design and high performance compounds. Vibram ensures that demanding workers have reliable and safe products for their professional activities, in any situation, in any weather condition or environment. Grip, stability, heat and oil resistance, electrical hazard rated, flexibility: a boot powered by Vibram improves worker efficiency, performance, reliability and comfort.

NIBRAM FIRE & ICE®

TIDE AUCE for

The Vibram[®] Fire & Ice[™] compound has been studied for extreme applications and maintains its performance values in a wide range of temperatures (from – 20°C to + 250°C). The formulation satisfies both requirements for fire resistance from NFPA and the Ross cold flex at -23°C.

Deciphering The Symbols

CSA Green Triangle

Indicates sole puncture protection with Grade 1 protective toecap which can withstand impacts of 125 joules (22.7 kg object falling from 56 cm above).

CSA White Rectangle with Orange Omega

Indicates soles that provide electric shock resistance. Intended to withstand 18,000 volts at 60Hz for one minute without disruptive discharge to ground; leakage current not exceeding 1mA.

CSA Yellow Rectangle

Indicates soles are static-dissipative. Warning: This footwear should not be used where contact with live electrical conductors can occur.

CSA Blue Rectangle

Indicates Grade 1 protective toecap without sole puncture protection.

CSA Dark Grey Rectangle with White M

Indicates metatarsal protection. Note: Toe protection is required for all metatarsal protective footwear.

These boots are intended for industrial work environments where heavy objects can hurt the metatarsal region of the foot.

The Language of Footwear

ANSI

International standards organization that develops and publishes voluntary consensus technical standards for a range of materials.

Aerospace Lining

A breathable synthetic lining comprised of a mesh-like structure.

Anti-microbial

A chemical treatment applied to footwear linings which prevents microbe growth.

ATCP

Aluminum toe, composite plate.

Cement Construction

A shoe construction in which the upper of a shoe is cemented, rather than stitched, to the bottom of a shoe. Cement construction results in a lighter, more flexible shoe.

Contoured Footbed

An insole that molds to the shape of your foot.

Composite Plate

A safety, puncture resistant sole plate used in safety footwear in replacement of steel plates. A few varieties exist today, made of synthetic materials such as nylons, resins and also Kevlar.

СТСР

Composite toe, composite plate.

Dri-Tec

A generic term for breathable, moisture-wicking lining found in footwear.

Dual Density Midsole

A midsole that employs two different densities of cushioning foam.

ESR

Electrical shock resistance.

EVA

Ethylene Vinyl Acetate – A synthetic compound used for outsoles. EVA provides cushioning to the footbeds, midsoles, and is easily shaped by heat and pressure.

Footbed

Sometimes also referred to by customers as the insole. It is the foundation in footwear that rests under the foot and has a critical role in comfort.

Goodyear Welt Construction

A shoe construction in which the upper and sole of the shoe are stitched together, resulting in greater durability. The resulting seam is visible and runs around the outside of the shoe, where the upper and outsole meet.

Green Diamond Technology

Patented silica carbide crystals are embedded throughout the rubber outsole which are durable and long lasting traction on ice.

Heel Counter

Counters provide support and help the upper wrap around the foot.

Injection Molded Construction

A type of sole unit construction created by injecting material into the sole mold. Injection molded construction is an efficient way to mass-produce footwear.

Inseam

The hidden seam of a welted shoe holding together the welt, upper, lining and insole.

Metguard

A safety feature found in some boots which is comprised of a protective cap that covers the metatarsal area of the foot and protects against injury from impacts. Can be internal or external.

Moisture Wicking

Synthetic materials that have been developed specifically to channel perspiration away from the body.

Nubuck Leather

Nubuck is a type of leather with a soft, velvety surface and is far more durable than suede.

Oarprene

Rubber that is acid and oil resistant.

OrthoLite

OrthoLite insoles are made up of open-cell foam, allowing air to circulate around the foot, keeping it cooler inside the shoe. The open cell structure also moves moisture away from the foot, keeping it drier.

PU

Polyurethane; a type of man-made material.

PVC

Polyvinyl chloride. A semi-rigid plastic, often used in heel counters and outsoles for added support.

SD

Static Dissipating. The shoe dissipates static buildup on the body so as not to cause an arcing effect.

STSP

Steel toe, steel plate.

STCP

Steel toe, composite plate.

TPR

Thermo plastic rubber. A plastic material used by many manufacturers in the injection molding process.

TPU

Thermopolyurethane. Man made material used in footwear production on uppers, but also outsoles.

Upper

The part of the shoe that covers the top part of the foot, from heel to toe.

Welt

A strip of material sewn between the insole and the outsole to create greater durability.
